Description of data on metanorms

The folder "Data on metanorms" contains data on tightness from the International Study of Metanorms, collected in 57 countries during April 2019 - January 2020.

The file *ISMN_10_rows_per_subject* contains all the individual level data used in the metanorm analyses, with 10 rows per subject (one for each scenario). The focal variables are number 2 (Country) and numbers 76-83 (Standardized appropriateness rating of social ostracism in this scenario, Standardized appropriateness rating of non-action in this scenario, Standardized appropriateness rating of gossip in this scenario, Standardized appropriateness rating of verbal confrontation in this scenario, Standardized appropriateness rating of the norm violation in this scenario, Global mean of the appropriateness rating of the norm violation in this scenario, Appropriateness rating of the norm violation in this scenario centered on the global mean, Country mean of the centered appropriateness ratings of the norm violation in this scenario). These variables are used to estimate metanorms per country.

The file *Metanorms_and_other_country_measures* contains the metanorm estimates per country, together with the other country measures used in the paper.

The file *Metanorms in countrysamples* contains metanorms estimated separately among students and nonstudents in the same country.

The file *Metanorms per city* contains metanorms estimated separately for each city in the same country.

The file *Correlations of appropriateness in each country* contains data associated with Fig. 1 in the manuscript, that is, correlations across scenarios between country-level appropriateness ratings of norm violations and a given reaction to them.
